

Backups made easy with storage in the cloud

Data backup is similar to a form of insurance, although it's often overlooked by many believing it's not a necessity. Many don't stop to think of the consequences surrounding data that is not backed up and what would happen if it was all lost.

As cloud technology continues to emerge as do the products and services of offsite backup, keeping your backups in the cloud creates an additional layer of protection providing the stress-free ability to recover data in the event of natural disasters, accidental deletion or even theft.

If you already have existing backup technologies ask yourself, how long is the retention period? Can you recover that deleted file from 3 months ago? Can you recover the whole system state or just files in the event of data loss?

New cloud technologies can provide automated, secure and reliable backups with abilities to recover the complete state of a computer or server to another of a different type. In the instance of a disaster have your environment up and running within a few short hours, not days.

The process of cloud backup combines incremental selection to ensure recently modified data is backed up, data compression to reduce file size over the internet, encryption to ensure secure transmission and then storage at the data centre. Files and folders can be accessed via a web interface for easy access and restoration even when you are on the move away from your home or office.

Managed BITS are your local cloud experts, call our friendly staff to organise a free onsite business IT appraisal. Ensure you're getting the most out of your existing and future IT investments.
